

Biology Tutorial-2

1	Explain How Lipids are utilized in the production of Bio Diesel and Detergents Discuss the Economic and Environmental impact of these applications.
2	Explain how carbohydrates are utilized in the production of cellulose based water filters
3	Explain the process of photosynthesis in plants and discuss how understanding this process has led to advancements in solar energy techniques.
4	Explain the mechanism of echolocation used by bats and dolphins. Evaluate how these principles have been applied in the development of sonar and navigation system
5	Discuss the application of nucleic acid in vaccine development and diagnosis. Provide example to support your explanation
6	Describe the role of PHA and PLA in bio plastics. Compare the properties and application.
7	Describe the principles of bird flight and analyze how these principles have Influenced the design of modern aircraft
8	Discuss the application of enzymes in biosensor fabrication. Describe the principle Behind the enzyme based biosensors
9	Explain the significance of proteins in food production. Write the industrial process where proteins are crucial
10	Describe the lotus leaf effect and its self cleaning properties and evaluate how this phenomenon has been utilized in developing water repellent materials
11	Illustrate the use of enzymes in food processing.
12	Discuss how the structure of plant burrs inspired the invention of Velcro, and analyze the key factors that made this biomimetic innovation successful.
