

<i>Module -3</i>			
<i>Q. No.</i>	<i>Question's</i>	<i>Bloom's LL</i>	<i>COs</i>
1	Apply the MongoDB query language to insert a document with the fields: name, age, and city into a collection named students.	L3	CO3
2	Demonstrate how to retrieve all documents from a MongoDB collection named products where the price is greater than 100.	L3	CO3
3	Use appropriate MongoDB data types to design a schema for a simple blog application that includes fields like title, author, publishedDate, and comments.	L3	CO3
4	Analyze the key differences between terms used in RDBMS (like table, row, column) and MongoDB (like collection, document, field). How do these differences influence data modeling?	L4	CO3
5	Compare and contrast the advantages of MongoDB over traditional RDBMS in terms of flexibility and scalability.	L4	CO3
6	Examine a given MongoDB document and identify the data types used. Discuss how each type impacts storage and query performance.	L4	CO3

<i>Module -4</i>			
<i>Q. No.</i>	<i>Questions</i>	<i>Bloom's LL</i>	<i>COs</i>
1	Write a HiveQL query to retrieve all records from a table named employees where the salary is greater than 50,000.	L3	CO4
2	Demonstrate how to define and use a User Defined Function (UDF) in Apache Hive to calculate the square of a number.	L3	CO4
3	Apply Pig Latin to load a dataset from HDFS, filter the records where age > 30, and store the result in another directory.	L3	CO4
4	Analyze the key differences between Hive and Pig in terms of their architecture, data flow, and use cases. Under what conditions would you prefer one over the other?	L4	CO4
5	Evaluate the performance and ease of use of Hive and Pig when processing large volumes of semi-structured data. Justify your preference with examples.	L5	CO4

<i>Module -5</i>			
<i>Q. No.</i>	<i>Questions</i>	<i>Bloom's LL</i>	<i>COs</i>
1	Apply Spark transformations and actions to clean and analyze a dataset of customer reviews.	L3	CO5
2	Demonstrate how to implement a basic PageRank algorithm using Spark for a small web graph dataset.	L3	CO5
3	Use a text mining tool or library to extract frequently occurring keywords from a set of web documents.	L3	CO5
4	Analyze the key differences between text mining and web mining. How does the source and type of data affect the analytical approach?	L4	CO5
5	Evaluate the advantages of using Apache Spark over traditional MapReduce for real-time web usage analytics. Justify your answer with practical scenarios.	L5	CO5
